In dimensional analysis, a ratio which converts one unit of measure into another without changing the quantity is called a conversion factor. For example, kPa and bar are both units of pressure, and $100 \text{ kPa} = 1 \text{ bar}$. The rules of algebra allow both sides of an equation to be divided by the same expression, so this is equivalent to $100 \text{ kPa} / 1 \text{ bar} = 1$.

Most elastomers (solid, rubberlike materials) have very little compressibility compared to their shear flexibility. This behavior does not warrant special attention for plane stress, shell, membrane, beam, truss, or rebar elements, but the numerical solution can be quite sensitive to the degree of compressibility for three-dimensional solid, plane strain, and axisymmetric analysis elements.
