*The Japanese cross-point drivers also have the self-centering
and quick tool and screw engagement, however the “JIS”
(Japanese Industrial Standard) design allowed torque and
over-tightening to be controlled by the operator and not at
the head of the screw. This key difference is why Phillips
screwdrivers cannot properly engage “JIS” (Japanese
Industrial Standard) screws.*

The JIS (Japanese Industrial Standard) screw is commonly found on Japanese motorcycles and equipment. Also called cross point screws. It looks like a Phillips screw, but is designed not to cam out and will therefore be damaged by a Phillips screwdriver if it is too tight. Heads are usually identified by a single dot or an "X" to one side of the cross slot . Does your Phillips screwdriver ...
